

# Juvenile arrests, 2007

The ratio used for this map is the number of incidents per 10,000 residents. This ratio makes it possible to compare the crime rates in counties with very small populations to those with very large populations. It should not, however, be confused with the actual number of incidents reported, which can be much smaller or much larger, depending on the population of the county.

## Juvenile arrests per 10,000 population
